

Set allowed applications

Last Modified on 11/18/2021 4:05 pm EST

Read this to learn how to set the allowed applications for your organization.

Overview

If you're deploying MultiLine, Movius for BlackBerry, MultiLine for Intune, or one of our other integrations, you need to add them to the **Allowed Applications**. You can also set the minimum application version to ensure that user applications are receiving proper security updates and bug fixes.

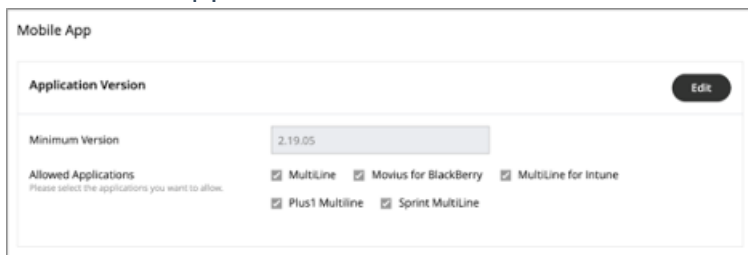

This setting is under **Mobile App** in the **Setup** tab.

Before you Start

- An admin must have "Setup" Role in the organization to do these instructions. See *What Admin Roles are in the Management Portal*.

Set Allowed Applications

1. Go to the **Setup** tab.
2. Click **Edit** for **Application Version**.

The screenshot shows the 'Mobile App' configuration page. Under the 'Application Version' section, there is an 'Edit' button. Below that, the 'Minimum Version' is set to '2.19.05'. The 'Allowed Applications' section has a sub-header 'Please select the applications you want to allow.' and five checkboxes, all of which are checked: 'MultiLine', 'Movius for BlackBerry', 'MultiLine for Intune', 'Plus1 MultiLine', and 'Sprint MultiLine'.

- Use the **Minimum Version** field to set the minimum version of MultiLine that users can use.
- Set the **Allowed Applications** by checking or unchecking the box for the items.

You're done!

Users in the organization will now only be able to use the selected apps.
