Handling international numbers - MultiLine

Last Modified on 01/20/2025 4:12 pm EST

Read on to learn about how the MultiLine application handles international numbers.

Overview

MultiLine enforces the [E.164 international phone standard](https://en.m.wikipedia.org/wiki/Open_numbering_plan) for numbers in the application. When you enter a number for a new contact or dial a number, MultiLine will prevent common formatting errors such as missing country code or extra spaces and normalize the number according to the standard. This prevents errors when sending messages or making calls to international numbers. By default, the dialer will show the country code of your MultiLine number.
