MultiLine Android App v. 4.05.02 Release Notes

This is the content of the Version 4.05.02 release of MultiLine and MultiLine for Intune Android apps.

What's New?

Short Code Dialing Experience Improvement

After introducing standardization to conform to the E.164 format ↗ (https://en.wikipedia.org/wiki/E.164) ↗, when dialing a short code (including emergency numbers 911 and 988) it was necessary to manually delete the country prefix before dialing a short code. To avoid this inconvenience, this release will automatically remove country prefixes when dialing short codes.

Support for dialing all non-emergency short codes

Dialing all non-emergency short codes is now supported.

Support for Canadian French

MultiLine apps now support Canadian French for all labels, notifications, and error messages in the app. MultiLine will automatically switch to French based on the device's language settings and support French keyboard layouts and date/time formats.

Bug Fixes

ID	App	Description
