Version 4.08.01 | MultiLine and MultiLine for Intune-iOS

Last Modified on 05/12/2025 1:33 pm EDT

MultiLine iOS App v. 4.08.01 Release Note
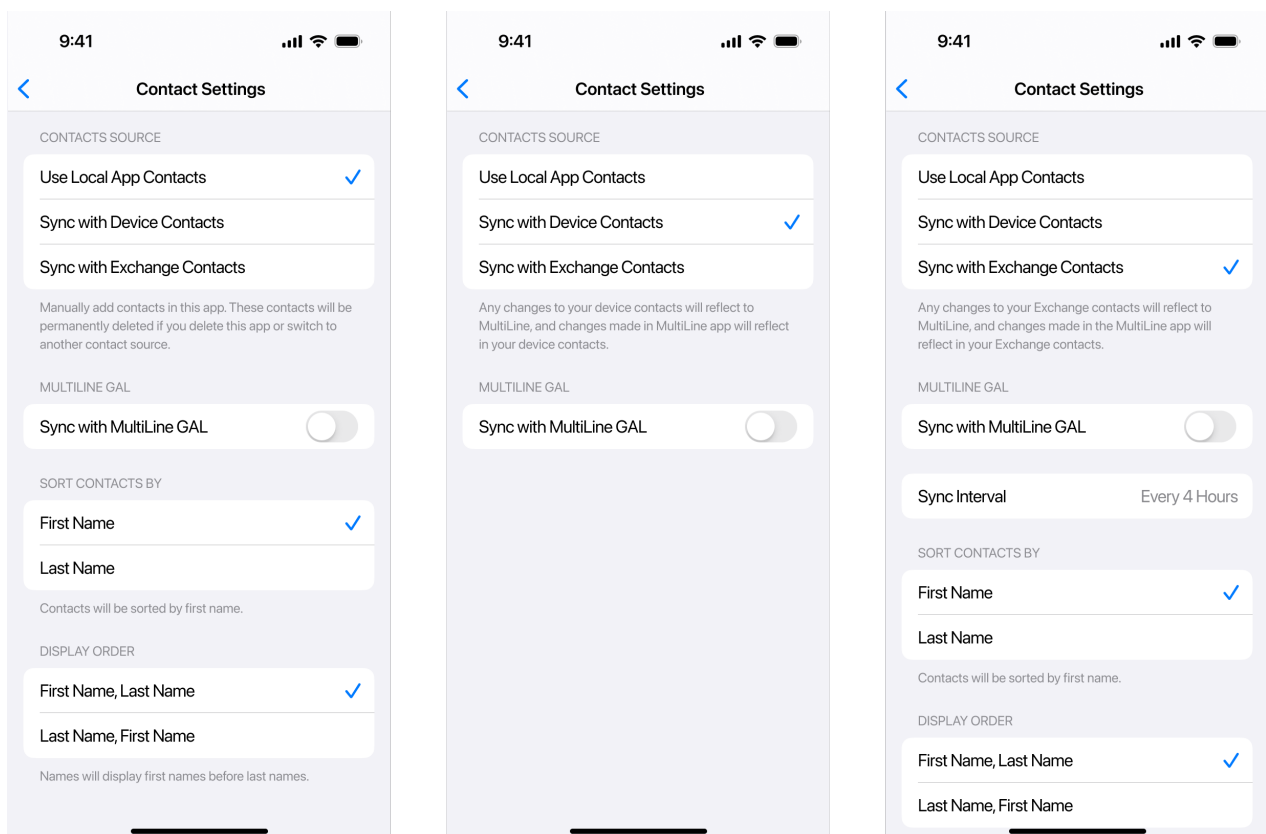

Target dates for release to App Store:

- MultiLine for Intune |To Be Updated
- MultiLine | To Be Updated

What's new?

1. Contact Settings UI/UX improvements

- We've updated the contact source list text to enhance clarity and usability.
- Additionally, the descriptions and alert messages shown when changing contact sources have been revised to provide more explicit guidance and reduce confusion.

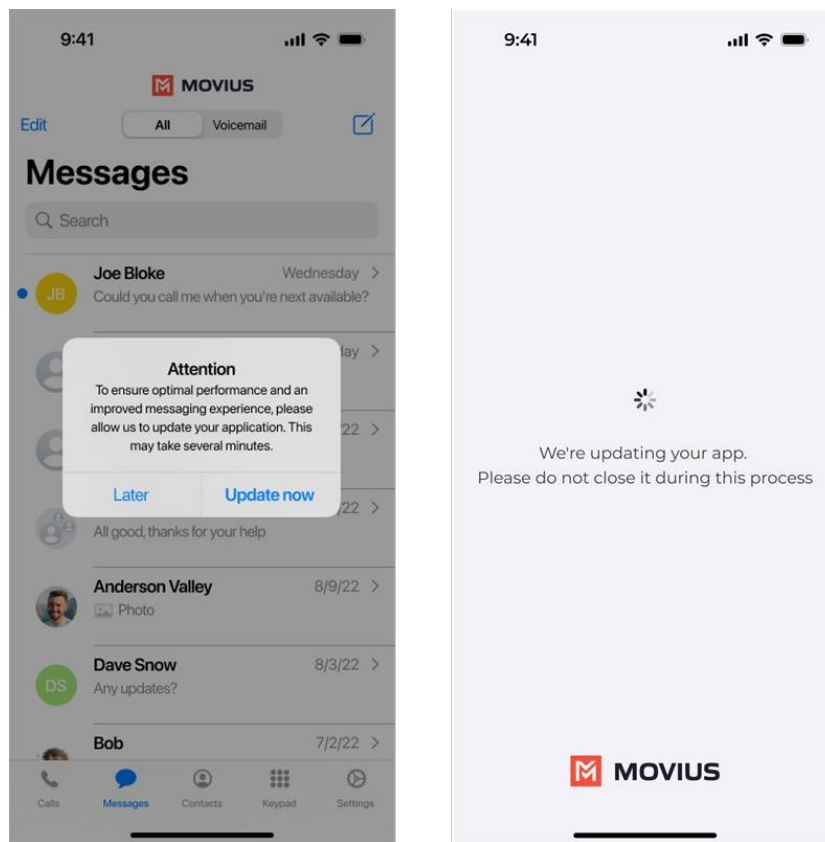

2. Messages performance enhancement

- We've optimized the message loading experience for users with a large number of message threads. This update addresses common performance issues in the following scenarios:
  - Reopening the app after a "swap and kill" event (i.e., when the OS terminates the app).
  - Re-onboarding after logout or reinstall.
  - Resuming the app after extended idle periods.
- When you navigate to the Messages tab, you'll be prompted to allow an update to improve
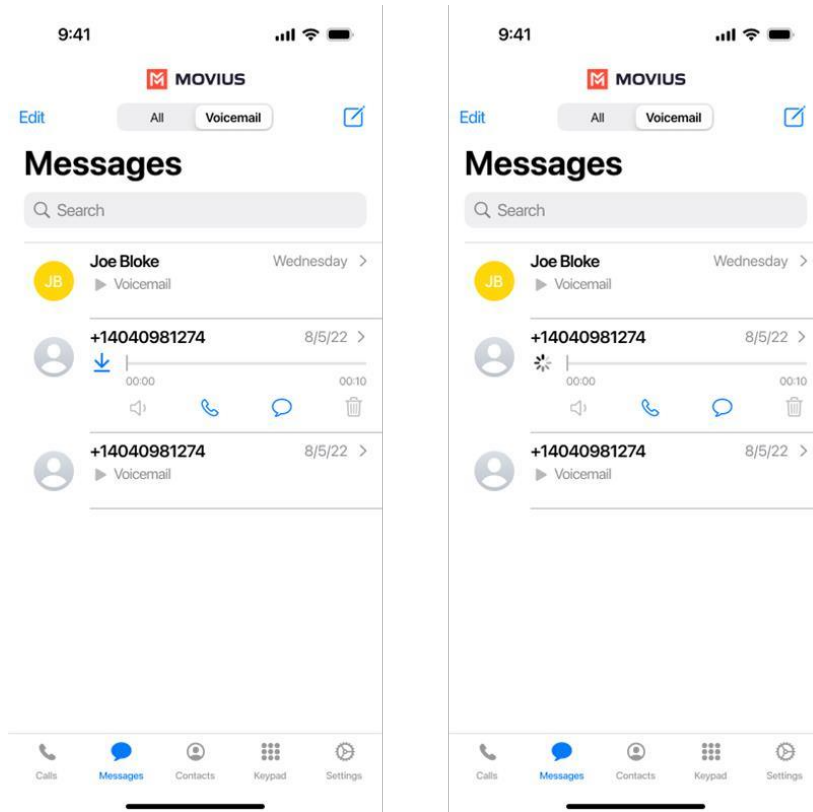

performance. This process typically takes only a few seconds but may take longer depending on the number of message threads in your account.

- If you decide to update it later, the pop-up message will be displayed again after 24 hours.

3. Voicemail Message Improvements

- We've enhanced voicemail functionality to ensure more reliable, real-time delivery of messages and clearer issue notifications.
- If a voicemail audio file isn't immediately available — such as in the case of a network connectivity issue — you'll now see an option to manually download the message, improving access and reducing uncertainty.

Bug Fixes and Performance Improvements

- **Voicemail Delivery Fix**: Resolved an issue where voicemail messages were delayed—often due to network issues—causing users to miss notifications in certain cases.
- **WeChat Notification Fix**: Fixed a bug where opening a new WeChat message from a notification incorrectly displayed the WhatsApp icon instead of the WeChat icon in the message thread.
- **General Enhancements**: Additional improvements have been made to overall app performance and reliability.
