Version 4.12.01 | Android MultiLine and MultiLine for Intune Release

Last Modified on 10/10/2025 11:51 am EDT

MultiLine Android App v. 4.12.01 Release Notes

Target dates for the releases:

- MultiLine for Intune | ~~October 9, 2025~~ New date will be communicated soon.
- MultiLine | September 28, 2025 - **Released**

During internal testing of the new **iOS** app version, we identified a crash that is currently under high-priority investigation by our engineering team. To maintain consistency across platforms and ensure a seamless experience for all users, **the release for both Android and iOS** has been temporarily postponed while our team investigates and resolves the iOS issue.

We appreciate your understanding and will communicate a revised release date as soon as the issue is resolved and validated.

Thank you for your continued support.

What's new?

1. Satellite Network support

- The MultiLine mobile app now supports Satellite Phone Service on devices with this capability, allowing for seamless connectivity in open areas where traditional cellular or Wi-Fi coverage is not available.
- When connected via satellite, users can send and receive messages via SMS, MMS, WhatsApp, WeChat, and LINE, as well as access voicemail.
- Initially, while on the satellite network, specific functions such as voice calls, Exchange contact sync, and onboarding will be disabled due to satellite bandwidth restrictions.
- The app will provide feedback when these features are unavailable.

See **Using MultiLine on Satellite Network** (https://help.moviuscorp.com/help/using-multiline-mobile-app-on-satellite-network-september-2025) [↗] for more information.

2. Improved Country Code search

- Users can now search for a country by its name or code number when using the country code selector in the keypad or while adding/editing a contact.

Bug Fixes

- Minor bug fixes to improve performance.
