Version 4.14.02 iOS MultiLine and MultiLine for InTune Release Notes

Last Modified on 02/25/2026 9:21 am EST

Release Notes: Version 4.14.2 | iOS Mobile Client

InTune version available February 26, 2026 (subject to Apple approval)

MML version available February 27, 2026 (subject to Apple approval)

What's New

Network Resiliency Enhancement: Automatic Fallback from Restricted Wi-Fi to Cellular

Availability: iOS (Intune & MML App Store)
Supported OS: iOS 19, 18, 17, 16

Summary

This hotfix improves app resiliency when devices are connected to Wi-Fi networks that appear connected but cannot reach Movius backend services.

Previously, the app could become unresponsive because Advanced Wi-Fi fallback did not activate.

Version 4.14.2 enhances backend reachability detection and automatically switches to cellular data when required, preventing freeze conditions and restoring normal operation.

Key Improvements

- Detects backend connectivity failure even when Wi-Fi is connected

- Automatically triggers cellular failover

- No user intervention required

- Prevents unresponsive UI, message loading failures, and call interruptions

Customer Impact

- Improved reliability in restricted corporate Wi-Fi environments

- Enhanced stability for Intune-managed deployments

- No configuration changes required

Defect Resolution

CS-235079
Resolved an issue where the iOS client became unresponsive on restricted Wi-Fi because Advanced Wi-Fi fallback did not trigger. The app now automatically transitions to cellular connectivity when backend reachability fails.
